

Environmental Policy

EPSCO Ltd. has environmental performance inherent in the very nature of its work – using a range of specifically engineered chemicals, providing our clients an environmentally friendly alternative to traditional toxic substances.

We strive to improve environmental performance of our client's using specialised techniques, that actually offer positive impacts on efficiency, health, safety and environmental compliance of their systems.

Our client base includes sectors such as Mains Drinking Water, Marine, Oil & Gas, Power Generation, Food & Drink, along with various specialised Manufacturing facilities. Our continued focus and growth into new locations and markets, such as in the marine sector, allows our chemical applications to provide benefits to a wider section of the industry, especially where water is scarce.

Following application, our purposely formulated chemical blends are designed to be simply and effectively neutralised to ensure all regulatory requirements are fully complied with.

We at EPSCO have committed to maintaining and continually improving the environment, and our own environmental performance. Therefore, we have set procedures that examine and control any possible adverse impact on the wider environment resulting from our daily work activities.

Our commitment to the environment and the community is to:

- Maintain an ISO 14001 compatible environmental management system within the company.
- Work in compliance with all relevant environmental legislation.
- Deliver increased water savings through clients switching to our improved methodology.
- Prevent pollution of surrounding areas and marine environments, using less hazardous chemicals, conducting laboratory assessments, obtaining permissions and monitoring our discharges.
- Train employees about all responsibilities they have to deliver environmental best practice. This includes knowledge and use of our products, and awareness of actual and potential environmental issues.
- Use environmentally-friendly factors for materials, equipment, and supplier selection.
- Promote waste minimisation and the recycling of materials used in day-to-day business activities.
- Work towards minimising the amount of water used for our work activities through the development of more efficient processes.
- Ensure, our policy and implementation is reviewed annually or when other relevant changes occur.

In order to reinforce the commitment to the environment the company will communicate effectively, while drawing up and working towards a set of measurable objectives and targets determined by management.
